pharmaceutically active compounds. After administration, the coupled medicament wil not diffuse from the circulating blood into the interstitum. Clearance by liver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotting, vasodilation, function of exythrocytes, thrombocytes and leukocytes, immune responses, and blood levels of messenger molecules such as

The present sequence is the protein sequence of recombinant gelatin-like protein Hu-1 ADM48390. A claimed composition suitable as a substitute for plasma composition suitable as a substitute for plasma composition. The protein is a recombinant gelatin-like protein with a composition. The protein is a recombinant gelatin-like protein with a concular weight of at least 10 kba and at most 50 kba and an isoelectric concular weight of at least 10 kba and at most 50 kba and an isoelectric combinant gelatin-like protein, or a dimer, trimer or tetramer of the protein, is useful as a plasma expander that has a lower clearance rate from blood circulation, provides better and predictable regulation of clearance rate and which is less succeptible to proteolytic degradation than presently used gelatin-like proteins can be covalently attached to pharmaceutically cortive compounds apprehensive. Recombinant gelatin-like proteins can be covalently attached to pharmaceutically cative compounds. After administration, the coupled medicament will not diffuse from the circulating blood into the interstitium. Clearance by cliver and kidney will be kept to a minimum, ensuring a more constant plasma level of the medicament. Suitable medicaments include those involved in intervening blood clotthing vasodilation, function of cerythney expressed in the events and leukocytes, immune responses, and blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition useful as substitute for plasma, comprises solution of saline and recombinant gelatin-like protein having colloid osmotic function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 GPPGEPGPTGLPGPPGERGGPGSRGFPGADGVAGPKGPAGERGSPGPAGPKGSPGEAGRP

```
culture support comprises the step of coating a microcarrier bead with gelatine or galatine-like protein having a molecular weight of about 40-
CC 200 kDa, and optionally further comprising the step of immobilising the C gelatine or gelatine-like protein on the microcarrier. In this process, cmore than 75%, preferably more than 85% and more preferably more than 95% of the gelatine or gelatine-like protein has the same molecular weight.
CC of the gelatine or gelatine-like protein has the same molecular weight.
CC of 50.500 um size coated with a gelatine-like protein consists of microbeads of 50.500 um size coated with a gelatine-like protein consisting of at cleast 95% Oly-xaa-vaa triplets and containing at least 15% proline cresidues and less than 5% of hydroxyproline residues, with a molecular weight distribution showing a maximum between 40 and 200 kDa, at least 75% of the protein molecules having a molecular weight within 2% of the maximum. Large-scale production of expressed products can be accomplished with gelatine-coated microcarriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GEAGLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQAGVMGFPGPKGAA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the protein sequence of human recombinant gelatin -like polypeptide Hu-3, which has a molecular weight of approximately 54 kba and which contains multiple Gly-Xaa-Yaa triplets. In an example from the invention, recombinant Hu-3 was immobilised on polystyrene beads using a heterobifunctional crosslinking agent, and used in a spinner flask cell culture. A claimed process for the preparation of a cell
                                                                                                                                                                                                                                                                                                                                      480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is porcine alphal(I) collagen. The present invention relates to recombinant synthesis of collagens and gelatins derived from animals. Collagen is an important component of arterial scalaris, food and cosmetic industries. Collagen is an important component of arterial scalaris, bone grafts, drug delivery system, dermal implants, haemostats, and incontinence implants, and for treating autoimmune disorders such as rheumatoid arthritis. Collagen is useful in food products such as rheumatoid arthritis. Collagen is useful in vaccine formulations for treating viral infections, autoimmune diseases and cancer. Gelatin is useful in the manufacture or as a component of various pharmaccutical and edical devices and products, in food and beverage industries, in hair care and skin care products, as a glue or adhesive in various manufacturing processes, as a light-sensitive coating in various celectronic devices, as a photocoatist base in photolithographic processes, in printing and photographic applications, in laboratory application, and as a light as a light sensitive coating in various as a light and photographic applications, in laboratory application, and as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a light sensitive coating in various as a light as a li

The specification describes a method for producing an extracellular matrix protein is matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily capable of self aggregating in a cell which does not ordinarily converses optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-conto the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional contents depends on the post translational hydroxylarion of proline. The proteins depends which do not normally contain trans-4-hydroxyproline. The present sequence represents human collagen 1 (alpha1) helical region, which may be produced using the method of the invention
                                                                                                                                                                                                                                                                                                                                                          Production of extracellular matrix proteins containing 4-trans-hydroxyproline results in native self aggregating proteins, useful on medical implants.
                                                                                                                                                                                                                                                           ÿ

                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                 р
                                                                                                                                                                                           The present sequence represents a human type 1 (alphal) collagen protein. Peptides derived from the protien were used to demonstrate incorporation in 3.4-debydro---proline into the peptide, using the method of the invention. The specification describes a method for the incorporation of non-natural amino acid into a polypeptide. The method comprises reacting at least one 3.4-debydroproproline residue in the polypeptide with an epoxyproline residue. The method is quad containing at least one 3.4-debydroproline residue. The method is used for studying the effects of non-abtural amino acids on structure and function of polypeptides. The method is also useful for commercial production of collagen or mussel adhesive proteins (which are useful as bloadhesives), and for incorporating a widevariety of groups, including therapeutic ligands and biological probes,

The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily by droxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell, incorporating the nucleic acid sequence into the cell; and contacting the incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium concaining at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-hydroxyproline to allow at least one of the amino acids to be assimilated incorporated from a second to make how cell and incorporated into the extracellular matrix protein. The hydroxyproline into proteins this is especially useful in the recombinant production of proteins such as collagen, fibrinagen and produce functional proteins depends on the post translational hydroxylation of proteins depends on the post translational hydroxylation of proteins which do not normally contain trans-4-hydroxyproline. The present sequence represents a chimeric collagen I (alphal)/decorin to protein, which may be produced using the method of the invention

incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-6 hydroxyproline and allow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of postpeptides which do not normally contain trans-4-hydroxyproline. The present sequence represents chimeric collagen 1 (alphal)/transforming growth factor-betal (TGF-betal) protein, which may be produced using the method of the invention

----TGLPGPP 423

The invention relates to the production of mammalian collagen in plants. 2 clones: alpha3 and alpha22, spanning the human collagen type I gene were isolated from a MG-63 osteosarcoma library. Clone alpha3 contained 83 bp of the 5' untranslated region and the first 1920 bp of coding sequence, whereas clone alpha22 contained sequence encoding amino acids

თ

The 2 clones were used to generate a number of fragments which were used to generate a number of fragments which were used to generate a number of fragments which were used to construct composite sequences encoding variant collagen molecules. The fragments are: (A) containing nucleotides (nt) '-4 to 479; (B) containing the protein and bases (6-77 from the sequence encoding the corrections of the pro-collagen amino propeptide domain; (C) the whole of the amino propeptide domain (nt 7-479); (D) all of the amino-telopeptide domain (nt 7-479); (D) all of the amino-telopeptide domain (nt 474-534) and the N-terminus of the helicoidal region (nt 535-57-356 of the central helicoidal domain; (F) the BamHI-EcoRI (2803-4362) region of alpha22, encoding as 356-192 in the central helicoidal domain (c) treps of all 193-1454 in the C-propeptide domain; (G) the C-terminus of the C-propeptide domain (as 1346-1464) plus stop codors, and (H) as G but concing as 1349-1401 and also including the KDES motif for referring from the ER. This sequence represents a recombinant human collagen. The encoding gene was constructed from fragments (A), (D), (E), (F) and (G). The recombinant gene is used for expression of mammalian collagen. The plant cells. The transformed plants, their extracts and parts are useful compositions (e.g. as prosthesesses sponges or bandages) and in pharmaceutical, medical, odontological, cosmetic and biotechnological compositions (e.g. as prostheses for cardiac valves, ligaments or tendons; skin substitutes; gingival implants; microcapsules for partial surgical thread and components of ointments). They are suitable for treating any disorder related to collagen dysfunction and gelatin, produced from collagen, is urgical prostheses and foods 8888888888888888888888888888888888

2003-268312/26. GENBANK; P02452 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent

```
that increases or decreases the expression of the polynucleotide sequence that increases or decreases din neutonal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed segmence data for this patent did not form part of the printed segmental and an animal (e.g. specification) but was obtained in electronic form directly from WIPO at the printed segmental and the presented or the printed segmental and the printed segmental and the printed segmental and the presented or the printed segmental and the printed segmental and the printed segmental and the printed segmental se

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, delarivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increasingly expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially 959 ĠVVĠĹPĠQRĠERĠFPĠLPĠPSĠEPĠKQGPSĠASGERĠPPGPMGPPGLAĠPPĠESGREGAP 1018 1079 GPAGARGPAGPOGPRGDKGETGEQGDRGIKGHRGFSGLQGPPGPPGSPGEQGPSGASGPA 1138 for GPAGKEGGKGPRGETGPAGRPGEVGPPGPPGPAGEKGSPGADGPAGAPGTPGPQGTAGQR 619 GPTGLPGPPGERGGPGSRGPPGADGVAGPKGPAGERGSPGPAGP---KGSPGEAGRPGEA 736 GKAGERGVPGPPGAVGPAGKDGE-----AGAQGPPGP-----AGPA New composition comprising two or more isolated polypeptides, useful preparing a medicament for treating pain in an animal. 839 GPPGPAGPPGPIĞNVGAPGAKGARGSAGPPGATGFPGAAGRVGPPGPSGNAGPPGPP GPAGP - - - AGERGEQGPAGSPGFQGLPGPAGPPGEAGKPGEQGVPGDLGAPGPSGPAGEP 676 GLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQAGVMGFPGPKGAAGEP 1139 GPRGPPGSAGAPGKDGLNGLPGPIGPPGPRGRTGDAGPVGPPGPPGPPG 1190 GERGEDGFAGSP---GFQGLPGPAGPPGEAGKPGEQGVPGDLGAPGPSGPAG 820 Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung. ```
expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the particledides, an ethod for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more obypeptides or their artibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CIN) and spared nerve injury (CIN) in a animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequences.

The invention discloses a method for stimulating or inhibiting cell growth and/or division which comprises contacting or inserting into an animal cell a polypeptide comprising one of the deer antler cartilage cell (DACC) clones disclosed. More particularly, the method relates to these polypeptides stimulating mesenchymal cell growth and/or division and to transfecting these cells and chondrocytes with vectors carrying the genes of these polypeptides capable of stimulating chondrogenesis, osteogenesis, growth, repair, regeneration and/or restoration of the extracellular matrix. The chondrocytes selectively express genes required to form a cartilaginous matrix. The DACC polypeptides and polymodeotides are useful for identifying an agent that modulates the activity of the polypeptide, for stimulating mesenchymal cell growth and/or division by exposing animal mesenchymal cells to conditioned media or its active

growth and/or division by inserting into an animal cell, a compound which inhibits the translation of the polymuclectide encoding the DACC. The method and the polymethes are useful for stimulating mesenchymal cell growth and/or division or for stimulating chondrogenesis, cartilage, or connective tissue growth, repair, regeneration and/or restoration in an animal. The polymuclectides, polymethes, agonists and antagonists may be used in treatment modalities, specifically in gene therapy. The polymetide can be used as bait proteins in a two- or three-hybrid assay to identify other proteins, which bind to or interact with the polypeptide and are involved in modulating cell growth and/or division. The sequences presented in ABG93923-ABG93948 are the proteins encoded by the DACC cDNA clones

the invention relates to polymucleotides encoding novel human proteins or their active domains. The polymeptides, polymucleotides and antibodies caused against the polymeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polymeptides can be used as molecular weight markers, food supplements, and in antibody production. The polymeptides care used to identify compounds which bind to the polymeptides.

Polymucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polymeptides of the invention can be used to target drugs to a title as a tissue markers, and to isolate receptors or ligands.

Delympetides of the invention may also be useful in treating platelet disorders, stem cell disorders, seem cell disorders, seem cell disorders, wound healing, treating burns, promoting 1075 devdakdepadepadekderdegobraikgergikaersalaadepedepegepsaasaea 1135 771 immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antival; attibacterial; antiallergic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis; tissue regeneration; immune disorder. 1016 GAEGSPGRDGSPGAKGDRGETGPAGPPGAPGAPGAPGAPGPVGPAGKSGDRGETGPAGPPV GLPGAKGLTGSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGARGQAGVMGFPGPKGAAGEP diseases, Isolated polypeptides useful for treating anti-inflammatory diseas nervous system disorders, and for regenerating bone and cartilage protein; Antianaemic; osteopathic; antiinflammatory; GERGEOGPAGSP---GFOGLPGPAGPPGEAGKPGEOGVPGDLGAPGPSGPAG -----AGAOGPPGP. The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily dydoxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by the cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-slow at least one of the amino acids to be assimilated into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-incorporate trans-4-incorporate into the cell and incorporated such as sollagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional contains dependent on the post translational hydroxylation of proteins.
                                                                                  1138

US-09-548-608-18

Sequence 18, Application US/09548608

Patent No. 6355442

GENERAL INFORMATION:
APPLICANT: Orist, Per
APPLICANT: Bonde, Martin

TITLE OF INVENTION: A Method for Assaying Collagen Fragments
TITLE OF INVENTION: In Body Fluids, A Test Kit and Means for Carry
TITLE OF INVENTION: Method and Use of the Method to Diagnose the F

TITLE OF INVENTION: Method and Use of the Method to Diagnose the F

TITLE OF INVENTION: Method and Use of the Method to Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method and Use of the Method In Diagnose the F

TITLE OF INVENTION: Method In Method In Diagnose the F

TITLE OF INVENTION: Method In Diagnose In Diagnose The F

TITLE OF INVENTION: Method In Diagnose The F
